

1. Game: Rodent Rush
Team: Artem Bondar, Malakai Saechao
Section: 01
Spring 2026

2.

3. Compiling: Navigate to the cat-game-2026 file in cmd, do the standard clearTAGEclassFiles and clearGAMEclassFiles commands, buildTAGE, compile.

Running: "run.bat" command after doing the above compiling steps.

Networking: host player runs "runUDPserver.bat" and client player runs "runUDPclient.bat", and the host should be able to see where the client's player cursor is.

4. Your avatar is the cursor floating over the field, being a cat paw. You can move it around with WASD keys and place down towers on available slots with either 1 or 2. The 2 towers you can place are the basic cat and bomber cat, with the bomber cat being more powerful but double the price. Once you place the towers you want, you can start the wave by pressing P. Completing all waves results in an end screen message.

5. WASD to move the cursor around the map, 1 and 2 to place towers, 6 to delete tower, P to start the wave. 0 to orbit the tile you are hovering, and while in hover mode you can zoom in and out with q and e, then rotate the camera with arrow keys.

6. There are 4 white lights positioned above the map, serving a simple purpose of just illuminating the area and making it more visually appealing.

7. Network protocol: UDP server communicates the position of client user cursor to host player

8. TAGE changes:

- Added yaw(), pitch(), and roll() to GameObject
- Added GhostAvater.java and GhostManager.java

9.

Genre: Tower Defense (type of strategy)

Theme: Cartoon

Dimensionality: 2.5D

Activities: Strategically placing towers to stop enemies.

10. External Models: All the 3D models in the game were made by us.

Networking:

Skybox: It's not relevant to the gameplay but we added one, press 0 when hovering over a tile and use E and Q to zoom in and out and arrow keys to pan around and see it.

Lights: Lighting effects from 4 light sources clearly visible.

HUD: Always visible and provides key information about gameplay (health, money, which wave you're on, etc).

3D Sound: Added when enemies are killed.

Scenegrph:

Animation: The basic cat tower is animated when it attacks enemies.

NPCs: The enemies and cat towers you place.

Physics: Projectiles that cats throw.

11. Requirements we couldn't get to work:

We didn't get around to adding gamepad inputs. Network protocol doesn't allow for player 2 to see enemies or towers.

12. Added a parser to generate tiles from a .txt file. Grid tile-system created to allow for placing towers.

13. Malakai: Engineered most of the game mechanics, did the tower AI, physics, rat AI, and rat model.

Artem: Modeled and animated all the models besides the rat, did the textures, skybox, map design, game and gameplay design.

14. Every 3D asset and texture in the game was made by us or came with tag except for "stone.png" used for the rock obstacles.

15. Stone asset is from: <https://opengameart.org/>
